RESEARCH EXPERIENCE

- 2024–2025* **Noise-canceling feedback:**
Designed feedback protocols to generate deterministic dynamics in continuously monitored systems.
Applied noise-canceling feedback for 5-to-1 magic state distillation based on $[[5, 1, 3]]$ code.
Showed that noise-canceling feedback leads to a 300-400% boost in successful distillation probabilities.
- 2023–2025* **Quantum optimal control [1]:**
Generalized Pontryagin maximum principle to find the optimal control for general continuously monitored systems.
Solved for optimal control for oscillator state preparation problems, such as binomial codeword preparation, parametric cooling, and cat state to cat state transformation.
Showed that optimal control protocols lead to a 40-190% increase in the number of trajectories reaching the target state.
- 2023–2024* **ML-based Model reduction in nonlinear optics, NTT Research, Inc:**
Built a physics-informed neural operator-based learning architecture that approximates the unitary propagator for quantum harmonic oscillators, capable of solving for the dynamics of 256 separate initial conditions simultaneously.
- 2020-2021* **Stochastic path integral [6]:**
Formulated a stochastic action principle-based description of the optimal evolution of continuously monitored harmonic oscillators.
